Welcome to Underdog Technology's GisArc Pro workshop. In this workshop you will learn the basics of what GIS technology is and how to use the program GisArc Pro application inorder to explore many maps and the data that can be found in those maps. In general GIS technology stands for Geographic Information Systems. It is a computer tool that is used to examine many different types of data on a geographical map. With this tool you can find geographical data of your local neighborhood. Though this is a very basic explanation of GIS, at the beginning of this workshop your instructor will explain GIS more in detail and will answer any questions you may have. As you go through the different tutorials you will be able to understand GIS more and how to use the GisArc Pro application. After each tutorial you will be tasked with a scavenger hunt where you will be given a hint and tasked to find location using what you have learned from the tutorials. Through these scavenger hunts you will learn a little more about St.Louis City as you explore the city's map and its accompanying data.
